

Game Algorithm 1. Click the Start button to start the quiz 2. The user has to answer any basic math problem that can be added, subtracted, multiplied, or divided, (For example: $10/2+30$) 3. The user has to input an answer to that generated problem. 4. If the user gets the answer right, they move on, and if the user gets the answer wrong, they have 1 retake on the problem. Else they get it wrong, the quiz starts over. 5. There will be about 10 questions you have to answer, and there is no time limit to the test. 6. If you get a 10/10, you get a "Congratulations!" prompt If you get a 9,8,7,6,5,4,3,2,1, there will be a "Good Effort!" prompt. Can you put NO CALCULATORS! on the test and you can use scrap paper? Also make the problems and make the problems have specific decimal systems.

Here's an updated version of the math quiz that adds the following improvements:

Updates:

1. **"NO CALCULATORS!" Rule:** A clear instruction at the start of the quiz.
 2. **Scrap Paper Allowed:** Users are reminded they can use scrap paper.
 3. **Decimal-Based Problems:** Problems include specific numbers with decimals (rounded to 1 or 2 decimal places) for added challenge.
-

Code:

python

Copy code

```
import random
```

```
def generate_problem():
    """Generate a math problem with decimals for extra challenge."""
    operators = ['+', '-', '*', '/']
    operator = random.choice(operators)
    num1 = round(random.uniform(1.0, 50.0), 2) # Numbers with decimals
    num2 = round(random.uniform(1.0, 20.0), 2)

    # Ensure division results in a specific decimal system (rounded to 2
    decimals)
    if operator == '/':
        num1 = round(num1 * num2, 2) # Make num1 divisible by num2 for
        clean decimals

    problem = f"{num1} {operator} {num2}"
    answer = round(eval(problem), 2) # Calculate and round to 2 decimals
    return problem, answer
```

```

def math_quiz():
    print("Welcome to the Math Quiz Game!")
    print("RULES:")
    print("- NO CALCULATORS ALLOWED!")
    print("- You may use scrap paper to solve the problems.")
    print("\nPress 'Enter' to start the quiz.")
    input() # Wait for the user to start

    score = 0
    total_questions = 10

    for question_number in range(1, total_questions + 1):
        problem, correct_answer = generate_problem()
        print(f"\nQuestion {question_number}: Solve {problem}")
        print(f"(Round your answer to 2 decimal places, if necessary.)")

        attempts = 2 # Allow one retake
        while attempts > 0:
            try:
                user_answer = float(input("Your answer: "))
                if round(user_answer, 2) == correct_answer:
                    print("Correct! Moving to the next question.")
                    score += 1
                    break
            else:
                attempts -= 1
                if attempts > 0:
                    print("Incorrect. Try again.")
                else:
                    print("Incorrect. The quiz will restart.")
                    return math_quiz() # Restart the quiz
        except ValueError:
            print("Invalid input. Please enter a valid number (e.g.,
12.34).")

    # Final Results
    print("\nQuiz complete!")
    if score == total_questions:
        print("Congratulations! You scored 10/10!")
    else:

```

```
print(f"Good Effort! You scored {score}/10.")

# Run the quiz
if __name__ == "__main__":
    math_quiz()
```

Features:

1. **Decimal Numbers:**
 - Numbers include up to two decimal places for realism and challenge (e.g., $12.5 + 3.75$ or $15.0 / 2.5$).
 2. **Encourages Scrap Paper:**
 - A friendly reminder lets users know they can use scrap paper but calculators are not allowed.
 3. **Rounded Answers:**
 - Answers are rounded to **2 decimal places** to ensure accuracy and consistency.
 4. **Quiz Flow:**
 - Users have **two attempts per question** before restarting.
 - If they finish all 10 questions, they get a **final score** and a personalized message.
-

Example Problems:

- $12.50 + 3.75 \rightarrow 16.25$
 - $45.0 / 3.0 \rightarrow 15.00$
 - $9.5 * 4.2 \rightarrow 39.90$
 - $30.75 - 10.25 \rightarrow 20.50$
-

Here's the Python code updated to ensure no decimals are used in any of the problems or answers:

Code:

python

Copy code

```
import random

def generate_problem():
    """Generate a challenging math problem with integers only."""
    operators = ['+', '-', '*', '/']
    operator = random.choice(operators)
    num1 = random.randint(10, 50) # Larger integers for difficulty
    num2 = random.randint(2, 10)  # Manageable numbers for division

    # Ensure division results in an integer
    if operator == '/':
        num1 = num1 * num2 # Make num1 divisible by num2

    problem = f"{num1} {operator} {num2}"
    answer = eval(problem) # Calculate the correct answer
    return problem, int(answer) # Ensure answer is an integer for
division

def math_quiz():
    print("Welcome to the Math Quiz Game!")
    print("RULES:")
    print("- NO CALCULATORS ALLOWED!")
    print("- You may use scrap paper to solve the problems.")
    print("\nPress 'Enter' to start the quiz.")
    input() # Wait for the user to start

    score = 0
    total_questions = 10

    for question_number in range(1, total_questions + 1):
        problem, correct_answer = generate_problem()
        print(f"\nQuestion {question_number}: Solve {problem}")

        attempts = 2 # Allow one retake
        while attempts > 0:
            try:
                user_answer = int(input("Your answer: "))
```

```

        if user_answer == correct_answer:
            print("Correct! Moving to the next question.")
            score += 1
            break
        else:
            attempts -= 1
            if attempts > 0:
                print("Incorrect. Try again.")
            else:
                print("Incorrect. The quiz will restart.")
                return math_quiz() # Restart the quiz
    except ValueError:
        print("Invalid input. Please enter an integer.")

# Final Results
print("\nQuiz complete!")
if score == total_questions:
    print("Congratulations! You scored 10/10!")
else:
    print(f"Good Effort! You scored {score}/10.")

# Run the quiz
if __name__ == "__main__":
    math_quiz()

```

Features:

1. **Integers Only:**
 - All numbers and results are whole numbers. No decimals are used in the problems or answers.
 - Division problems are specifically crafted to produce integer results by ensuring `num1` is a multiple of `num2`.
2. **Math Problem Range:**
 - Problems include addition, subtraction, multiplication, and division with integers between 10–50 for `num1` and 2–10 for `num2`.
3. **Rules Reminder:**
 - The program explicitly states that calculators are not allowed but users can use scrap paper.
4. **Quiz Flow:**
 - The user has two attempts per question.

- If both attempts are wrong, the quiz restarts.

Example Problems:

- $40 \div 8 \rightarrow 5$
- $36 + 14 \rightarrow 50$
- $25 - 12 \rightarrow 13$
- $6 \times 7 \rightarrow 42$
