Notes
- Sensors bring the physical and digital world together
- You can use sensors for agriculture
- Also for changes in light
- You can add cameras which can detect color with a sensor
- You can wave at the sensor
- You can touch the sensor to do relays
- You can get data from the sensor using arduino
- How can you add a sensor to a project depends on the sensor
- You have to implement some code into the sensors.
- Just try different sensors and see how they work

Difference between analog and digital sensors

- If the sensor measures a range of values its a analog sensor
- If the sensor measures 2 states like presence/absence, it's probably a digital sensor
